

WHAT IS

SQL Defrag Manager?

SQL Defrag Manager is the only SQL Server defragmentation solution in the industry that automates the time-consuming process of pinpointing fragmentation "hot spots" and takes action to defragment automatically, or on demand.

PRODUCT REVIEWS

“...SQL Defrag Manager takes managing fragmentation to the next level. The tool allows you to manage your entire SQL Server environment and visually see where there are fragmentation issues. Whether you have one database or hundreds, having a graphical environment to see and manage fragmentation is much easier than dealing with lots of data points.” “...The real power comes with the Automation Policies. By setting up policies for your environment and scheduling these policies to run, you can tailor your index maintenance processing to meet your unique needs. As your policies mature over time, based on reviewing what is occurring, you can optimize your index maintenance. Also, having the ability to check system resources prior to an index rebuild or reorganization is key to not creating more problems when performing maintenance.”

—Greg Robidoux, MSSQLTIPS.com

“SQL Defrag Manager (2.5) does a fantastic job of wrapping SQL Server's native index defragmentation tools with a very intuitive and useful UI, and its automation policies are much easier to work with than custom scripts and jobs.”

—Michael K. Campbell, SQL Server Pro

WHAT CUSTOMERS ARE SAYING

“SQL Defrag Manager is very easy to manage. I simply set it then forget about it. If you are always trying to find the time to defragment SQL Server indexes, you should definitely take a look at SQL Defrag Manager.”

—John Burris, DBA, DMAC

“SQL Defrag Manager makes defragmenting SQL Server a breeze. It constantly analyzes SQL Server indexes and fragmentation levels and only defragments the indexes that really need it. This is not only a huge time savings, it also defragments during the slow times - usually while I'm asleep!”

—Database Administrator, DMAC

“With SQL Defrag Manager, SQL Server defragmentation has now become a streamlined task! The SQL Defrag Manager interface is really nice – I can quickly see any fragmentation “hot spots” that may exist across all of my SQL Servers. I can then schedule defragmentation to occur automatically, whenever it's convenient for my company.”

—Dave Devol, DealerPeak

“One of the most difficult tasks in my day to day operations has been to maintain index optimization. SQL Defrag Manager allows me to configure automated index maintenance based on the fragmentation level of the individual indexes. The maintenance process runs each night, takes a fraction of the time it used to and has very little load impact. I find SQL Defrag Manager to be an indispensable tool in my day to day duties as a DBA.”

—Senior DBA, Online Publishing Company
